

1.EPICS:

The image displays two screenshots of the Jira web interface, specifically the 'CSCAM board' backlog. The top screenshot shows the first 17 items in the backlog, which are user stories grouped into five epics. The bottom screenshot shows the same backlog after scrolling down, revealing items 18 and 19, which are also mapped to the same five epics.

Reflection Questions & Answers

1. Did your estimations reflect the actual effort?

Yes, the story point estimations were reasonably close to the actual effort required. Some tasks

took more effort than expected, but overall the Fibonacci-based estimates helped us plan the sprint effectively.

2. Was your backlog well-prioritized?

Yes, the backlog was well-prioritized based on the importance and dependencies of the requirements. Higher-priority and essential functionalities were considered first, which helped us organize the sprint effectively.

3. How did your simulated sprint align with your plan?

The simulated sprint generally aligned with our plan. We moved the stories through different stages such as To Do, In Progress, In Review, and Done. Some stories remained unfinished, which realistically represented changes and limitations during a sprint.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed how the remaining work changed throughout the sprint. It helped us understand the team's progress and capacity, and showed that the team was able to complete a significant portion of the planned work while some work remained for the next sprint.
